PROFESSIONAL SUMMARY

Technical leader with deep experience owning the full lifecycle of production services in Linux-based, multi-VM distributed systems environments — deployment, monitoring, incident response, capacity planning, and post-incident learning. Strong in Go, AWS, Kubernetes, and Terraform; comfortable troubleshooting across cloud, on-prem, and hybrid environments. Proven record turning customer escalations and production incidents into durable reliability architecture, decomposing high-risk rollouts into safe staged changes, and representing platform decisions across product, engineering, and field teams. Effective at directing AI tools (Claude Code, GitHub Copilot, Codex) to ship safe, testable code across the full SDLC while owning the design, quality bar, and business outcome.

CORE STRENGTHS

- **Languages and automation:** Go, Python (scripting and Lambdas), Java, Spring Boot, REST, gRPC, JSON/HTTP APIs, shell scripting
- **Cloud and IaC:** AWS (Lambda, ECS, EKS, S3, SQS/SNS, DynamoDB, Secrets Manager), GCP, Terraform modules, Terraform pipelines, multi-account and multi-region infrastructure, sovereign/GovCloud environments
- **Kubernetes and Linux distributed systems:** Kubernetes-orchestrated services on EKS, container and VM-based workloads, service-to-service auth, secret synchronization, deployment validation, multi-region HA
- **Reliability and operations:** production ownership, incident response, DLQ recovery, runbooks, post-incident learning, observability and metrics instrumentation, capacity and rate-limit governance
- **CI/CD:** Jenkins, serverless AWS-based CI/CD pipelines, staged Terraform rollouts, deployment validation across environments
- **Security platforms:** Kong API Gateway, authorization services, OAuth 2.0, OIDC, OPA policy enforcement, API key management, secure coding
- **Technical leadership:** architecture, cross-team coordination, customer escalations, mentoring, agile delivery, written and verbal communication
- **AI-assisted SDLC:** daily use of Claude Code, GitHub Copilot, and Codex across implementation, IaC, testing, debugging, code review, and design exploration

EXPERIENCE

Cisco

Software Engineering Technical Leader

November 2025 - May 2026 | Austin, TX

- Owned the production lifecycle of backend platform services — **API Gateway, Authorization Service**, and Third-Party Integrations Service — across deployment, monitoring, incident response, and capacity decisions in a Linux-based multi-VM distributed systems environment on AWS and Kubernetes (EKS).
- Prevented security-event message loss during a production webhook incident by identifying a **300k+ message DLQ backlog**, quantifying impact across **15 orgs**, redriving messages within **5-10 minutes**, and leading the post-incident review that produced durable retention and alerting fixes.
- Drove integrations-svc production readiness across **sovereign and multi-region environments** by decomposing a high-risk **Terraform** rollout into staged changes spanning ECR, Secrets Manager, DynamoDB streams, SNS, service config, and audit logging — validating HA behavior across at least two regions and enabling rapid, safe deployment in a SaaS environment.

- Resolved a customer-scale onboarding failure by tracing **250+ appliance registration requests** through API key authentication, Kong, and APIGW rate-limit behavior, applying targeted Linux/container-level debugging to unblock the customer and driving durable fixes around retry/backoff, token reuse, and service ownership.
- **Diagnosed and fixed a Jamf / Intune integration issue live during a prospective customer evaluation**, restoring product confidence and **contributing to the customer's purchase decision**.
- Mapped Authorization Service TLS secret synchronization and API key refresh behavior across deployment tooling, AWS Secrets Manager, Kubernetes, and Kong — reducing ambiguity for security-sensitive automation and enabling safer secret rotation.
- Led design and delivery of push security events using the open **CloudEvents** standard, delivering **alpha on schedule (Nov 2025)** with a team of three engineers — a long-awaited feature enabling real-time security event delivery to customer systems.
- Drove cross-service design for customer-selected **Splunk** and **CloudEvents** webhook formats across alerts, security events, integrations, and notifications services; analyzed multi-region failover design for an API anomaly detection pipeline spanning Kinesis Firehose, S3/Iceberg, EMR on EKS, SQS/SNS, DynamoDB, and webhook delivery.

Senior Software Engineer

January 2021 - November 2025 | Austin, TX

- Advanced Cisco Secure Access / APIX platform across API gateway, authorization, integrations, and event-delivery domains, growing into production ownership for backend platform services running on AWS and Kubernetes.
- Built and operated automation and reliability tooling in Go and Python — including **auth-tools**, an internal authorization library adopted across multiple platform services to simplify OAuth/policy enforcement, and a Lambda-based signing-key rotator for service credentials.
- Implemented metrics instrumentation for the Authorization Service and Integrations Service, improving observability into production traffic and authorization decisions.
- Owned and evolved CI/CD pipelines (Jenkins and serverless AWS-based) for backend platform services, enabling rapid, safe deployment of changes to SaaS environments.
- Conducted code reviews, authored runbooks and rollout plans, and led post-incident learning across the team; mentored early-in-career engineers through code review, design feedback, and hands-on guidance.
- Initiated “Tip Talk Tue,” a recurring team knowledge-sharing forum on engineering productivity and security practices.
- Led ISMAP security certification for the APIX platform, coordinating cross-functional compliance requirements and meeting all deadlines.
- Pioneered team-wide GitHub Copilot adoption ahead of broader Cisco AI initiatives; now applies Claude Code, Copilot, and Codex daily across implementation, IaC, testing, debugging, and code review.

Randstad Technologies US at Cisco

Senior Software Developer

March 2015 - January 2021 | Dublin, OH

- Designed and implemented Go-based gRPC and JSON/HTTP APIs for a cloud-native data ingestion platform on Linux, with OpenTSDB as the backing timeseries database for platform metrics.
- Built API-driven authentication and authorization flows using OIDC, OAuth 2.0, and gRPC-Web; extended Auth0 and Okta CIAM platforms with custom hooks, policies, and Terraform-based provisioning.
- Optimized query performance for large IP address ranges and contributed architectural improvements for caching, load balancing, push notifications, and clustered deployments.
- Reduced **100+ OWASP-reported security warnings to zero** through secure coding practices, browser security headers, input sanitization, and server-side validation.

Earlier Engineering Experience

Cognizant, Oracle, Collabera | December 2007 - February 2015

- Delivered backend services, internal tools, workflow applications, and integration features across financial services, enterprise content systems, healthcare, insurance, and public-sector domains.

- Built a foundation in Java, REST APIs, SQL/Oracle, service integrations, automation, testing, and maintainable engineering practices before moving into cloud-native platform work.

CERTIFICATIONS

- AWS Certified Solutions Architect - Associate
- AWS Certified Developer - Associate
- MongoDB Certified Java Developer M101J
- Google Cloud Platform Essentials

EDUCATION

Bachelor of Engineering, Information Technology
Dharmsinh Desai University
